

Setup Guide: VS Code, Git Bash & GitHub

This guide provides step-by-step instructions for downloading, installing, and configuring essential tools for development and version control.

1. Visual Studio Code (VS Code)

Visual Studio Code is a lightweight, open-source code editor used for writing and managing source code.

Overview & Download

Tool	Official Download Site	Supported OS
Visual Studio Code	https://code.visualstudio.com/	Windows, macOS, Linux

Installation Steps

- **Windows:**
 1. Download the installer executable (.exe) from the official website.
 2. Run the installer and accept the license agreement.
 3. On the **Select Additional Tasks** window, ensure the following options are checked:
 - Add "Open with Code" action to Windows Explorer file context menu
 - Add "Open with Code" action to Windows Explorer directory context menu
 - Add to PATH (requires shell restart)
 4. Click **Install**, then click **Finish** upon completion.
- **macOS:**
 1. Download the zip archive for macOS.
 2. Extract the downloaded file and move the **Visual Studio Code** application file into the **Applications** folder

2. Git & Git Bash

Git is a distributed version control system that tracks changes in source code during software development. Git Bash provides a Unix-style command line interface for Windows environments.

Overview & Download

Tool	Official Download Site	Supported OS
Git / Git Bash	https://git-scm.com/	Windows, macOS, Linux

Installation Steps

- **Windows:**
 1. Download the standalone Windows setup package.
 2. Execute the installer and accept the default directory locations.
 3. When prompted to choose the default editor, select **Use Visual Studio Code as Git's default editor**.
 4. Under PATH environment configuration, select **Git from the command line and also from 3rd-party software**.
 5. Under line ending conversions, choose **Checkout Windows-style, commit Unix-style line endings**.
 6. Complete installation by selecting **Install**.
- **macOS:**
 1. Open Terminal and run `xcode-select --install` to install Apple Command Line Tools containing Git.
 2. Alternatively, install via Homebrew using `brew install git`.

Verification & Initial Configuration

Open Git Bash (Windows) or Terminal (macOS) and run the following command to confirm the installation:

```
git --version
```

Set up global user information before making commits:

```
git config --global user.name "Your Name"
```

```
git config --global user.email your.email@example.com
```

3. Creating a GitHub Account

GitHub is a cloud platform for hosting Git repositories, supporting code collaboration and project management.

Account Setup Procedure

1. Navigate to <https://github.com/> and select **Sign up**.
2. Enter a valid email address and establish a password.
3. Select a unique username for your profile URL.
4. Complete the verification puzzle and enter the email verification code sent by GitHub.(stop here)
5. **Authentication:** When pushing commits to GitHub for the first time via VS Code or terminal, follow the browser OAuth prompt to authorize Git Ecosystem credentials.
